

DREAMLOG

Your AI Listener That Remembers Everything

Product Requirements Document

From Concept to Revenue

Version 1.0 • April 2026 • Solo Developer Build Plan

1. Executive Summary

DreamLog is a voice-first AI journaling app that lets users talk freely each night before bed — for as little as 45 seconds on quiet nights or up to 30 minutes when they need to truly unload. The AI transcribes, understands, remembers everything across weeks and months, detects emotional patterns the user can't see themselves, and delivers personalized insights that rival months of therapy — all for under \$8/month.

Unlike traditional journaling apps that require writing (high friction, most people quit within a week), DreamLog uses voice as the primary input — the most natural and effortless form of human expression. Unlike AI chatbots that forget everything between sessions, DreamLog builds a persistent emotional memory of the user that deepens over time, making it more valuable the longer someone uses it.

The Problem

Mental health is the defining crisis of this generation. Over 1 billion people globally suffer from some form of mental health condition. Therapy costs \$100–300 per session and has months-long waitlists. Journaling has proven clinical benefits but 92% of people who start a written journal abandon it within 2 weeks. Meditation apps like Calm and Headspace are passive — they don't actually know you or adapt to your specific struggles. The result: hundreds of millions of people with no affordable, personalized, consistent mental health support.

The Solution

A nightly voice check-in that takes less effort than brushing your teeth. You talk, the AI listens, and over time it becomes the most attentive, perceptive, and consistent “listener” in your life — one that never forgets, never judges, and sees the patterns you're blind to.

Why Now

- AI voice transcription (Whisper) is now near-human accuracy and nearly free
- LLMs (Claude, GPT-4) can now genuinely understand emotional context and nuance
- The mental wellness app market is \$7.3 billion and growing at 15%+ CAGR
- Gen Z and millennials are destigmatizing mental health but can't afford traditional therapy
- Voice-first interfaces are the next major interaction paradigm (AirPods, voice notes culture)
- Cal AI proved that a daily personal ritual + AI analysis = massive consumer product

2. Target Users & Personas

Primary Persona: “The Overthinker” (Age 20–35)

Young professionals and students who lie in bed at night with racing thoughts. They overthink conversations, worry about career decisions, replay awkward moments, and feel generally anxious but “not bad enough” for therapy. They’ve tried journaling and quit. They’ve downloaded Calm and forgot about it. They want someone to talk to at 11pm without burdening their friends. This is the core user — hundreds of millions worldwide.

Secondary Persona: “The Self-Optimizer” (Age 25–45)

People who track everything — sleep, calories, workouts, habits — but have no way to track their mental state objectively. They want data on their emotional patterns the same way they want data on their body. They’re drawn to the “mood analytics” and pattern detection features. They’ll pay premium for deeper insights.

Tertiary Persona: “The Therapy Supplement” (Age 25–55)

People already in therapy who want to process their thoughts between sessions. Currently they forget what they wanted to discuss with their therapist. DreamLog becomes the bridge — capturing daily thoughts and generating a “therapist prep” summary before each session. Therapists would actively recommend this tool.

Expansion Persona: “The Busy Parent” (Age 30–50)

Parents who have zero time for self-care. They can’t journal, can’t meditate, can’t go to therapy regularly. But they can talk into their phone for 2 minutes while lying in bed after the kids are asleep. This is a massive underserved market.

3. Core Product Experience

3.1 The Nightly Check-In (Core Loop)

This is the heart of DreamLog. Everything else in the product exists to support this single daily ritual.

Step 1: Open & Record

User opens the app at night. The screen is minimal, calming, dark-themed. One large button: “Talk to DreamLog.” They press and start speaking. No prompts, no structure, no required format. Just talk. The app shows a gentle audio waveform animation so they know it’s listening. A soft timer shows elapsed time (but doesn’t pressure). No minimum time — some nights are 45 seconds, others are 25 minutes. Most sessions naturally fall between 3–8 minutes. A gentle “Take your time” indicator appears at 15 minutes (not an interruption), and the hard cap is 30 minutes.

Step 2: AI Processing (5–10 seconds after recording)

The voice recording is transcribed via Whisper API. The transcript is sent to Claude along with the user’s complete emotional history (summarized to fit context window). Claude analyzes: emotional tone (anxious, hopeful, frustrated, content, etc.), key topics discussed, any recurring themes from past entries, any contradictions or shifts from previous statements, and any concerning patterns (escalating negativity, mentions of self-harm).

Step 3: The Reflection

After processing, the user sees a “reflection” screen. This is NOT a chatbot response. It’s a thoughtful, 3–5 sentence paragraph that mirrors back what they said, highlights something they might not have noticed, and offers one gentle reframe or question. Example:

“Tonight you talked about the tension with your team lead again — that’s the fourth time in two weeks. Each time, you describe the frustration differently, but the core feeling seems to be that you don’t feel respected. Last Tuesday you mentioned wanting to ‘just let it go,’ but it keeps coming back. That pattern usually means the issue matters more than you’re admitting to yourself. What would it look like to address it directly?”

This is the magic moment. The user feels genuinely understood and seen. The AI references specific things from past entries, draws connections they didn’t see, and asks the kind of question a great therapist would ask.

Step 4: Optional Deep Dive

After the reflection, the user can optionally tap “Tell me more” to have a brief 2–3 exchange conversation with the AI about tonight’s topic. This is not an open-ended chatbot — it’s constrained to the night’s check-in context to keep sessions focused and time-bounded. Or they tap “Goodnight” and the app gently closes with a calming animation.

Step 5: Morning Nudge (Next Day)

At a user-configured time the next morning, a push notification delivers a one-line personalized “nudge” based on last night’s entry. Not generic motivation — specific to what they said. Example: “You mentioned dreading the 2pm meeting. Remember: you prepared well. You’ve got this.” The nudge is actionable, brief, and makes the user feel like someone is in their corner.

3.2 Intelligence Features

Pattern Radar

The crown jewel of DreamLog. After 2+ weeks of entries, the AI starts surfacing patterns the user cannot see themselves:

- Recurring emotional triggers: “You feel most anxious on Sunday evenings — this has happened 6 of the last 8 Sundays”
- People patterns: “You mention feeling drained after every interaction with [person]. You’ve described them positively only once in 4 weeks”
- Contradictions: “You say you’re fine with the breakup, but you’ve mentioned your ex in 9 of the last 12 entries”
- Seasonal and cyclical patterns: “Your mood dips consistently in the last week of each month — could be related to work deadlines or hormonal cycles”
- Growth tracking: “One month ago you were paralyzed about the job change. This week you’re actively applying. That’s real progress.”
- Avoidance detection: “You’ve mentioned wanting to have a conversation with your dad 7 times but always pivot to another topic. What’s holding you back?”

Mood Map

An intelligent emotional timeline, not based on manually tapping emoji faces (which nobody does honestly), but derived from actual speech analysis:

- Daily emotional tone extracted from voice pitch, speaking pace, word choice, and content
- Visual graph showing emotional trajectory over weeks and months (like a health chart but for your mind)
- Tap any day to see the entry summary and what was happening
- Correlation engine: overlay mood trends with external factors (day of week, sleep mentions, exercise mentions, specific people, weather)
- Exportable mood reports for sharing with therapists

Conversation Companion

Unlike generic AI chatbots, DreamLog’s companion has memory and context spanning your entire history:

- Remembers promises you made to yourself: “Last month you said you’d start setting boundaries at work. How’s that going?”
- Follows up on unresolved threads: “You mentioned a difficult conversation with your sister three weeks ago and haven’t brought it up since. Did you resolve things?”

- Celebrates wins you forget: “Two months ago you were terrified of public speaking. Today you mentioned presenting without anxiety. That’s huge.”
- Gently challenges ruts: “You’ve described yourself as ‘stuck’ for 3 weeks straight. What’s one tiny thing you could change tomorrow?”

Therapist Prep Report

For users who see a therapist, DreamLog generates a pre-session summary:

- Top 3 themes from the past week/two weeks
- Emotional trend summary with notable shifts
- Specific moments or quotes the user might want to discuss
- Patterns the therapist should know about
- Exportable as a clean PDF the user can share or read from their phone

Life Chapters (NEW IDEA)

DreamLog automatically segments the user’s emotional life into “chapters” based on detected themes. Instead of an endless scroll of entries, users see their life organized as a narrative:

- “The Job Transition” (March–May): 47 entries, dominant emotions: anxiety then growing excitement
- “The Breakup Recovery” (January–February): 28 entries, tracked from devastation to acceptance
- “The Friendship Shift” (April): 12 entries about evolving feelings about a close friend

Each chapter has an AI-written summary, a mood arc, and the key turning points. Over years, users build a rich, meaningful story of their personal growth. This becomes the most emotionally valuable data they own.

Dream Decoder (NEW IDEA)

If a user talks about a dream they had, the AI detects this and offers optional dream interpretation. Not pseudoscience — based on established psychological frameworks (Jungian archetypes, common dream symbolism research). It connects dream themes to what the user has been processing emotionally. “You dreamed about being lost in a building. You’ve been talking about feeling directionless at work for two weeks. Your subconscious might be processing the same thing.” This feature drives engagement, is genuinely fascinating, and is inherently shareable.

Relationship Map (NEW IDEA)

Over time, the AI builds a map of the people in the user’s life based on who they mention and how they feel when talking about them. The user can see:

- Which people they talk about most (and in what emotional context)
- How their feelings about specific people have shifted over time
- Imbalanced relationships: “You give a lot of emotional energy to [person] but rarely describe receiving support back”
- Missing connections: “You haven’t mentioned [close friend] in 6 weeks — you used to talk about them often. Has something changed?”

4. Technical Architecture

4.1 System Overview

DreamLog follows a pipeline architecture: Voice Recording → Transcription → Analysis → Storage → Insight Generation → Delivery.

4.2 Tech Stack

Component	Technology & Rationale
Backend API	Go 1.22+ with Gin framework — fast, lightweight, excellent concurrency for handling audio uploads and AI API calls
Database	PostgreSQL — user profiles, entries (transcripts + analysis), emotional metrics, pattern data, relationship graph
Vector Store	pgvector extension on PostgreSQL — semantic search across entries for context retrieval during analysis
Cache / Queue	Redis — session caching, rate limiting, background job queue for async AI processing
Voice Transcription	OpenAI Whisper API — near-human accuracy, supports 50+ languages, ~\$0.006/minute
AI Analysis Engine	Claude API (Sonnet for nightly reflections, Opus for weekly pattern reports) — superior emotional nuance and long context handling
Voice Tone Analysis	Custom Python microservice using librosa/pyAudioAnalysis for pitch, pace, energy extraction from audio before transcription
Mobile App	React Native (Expo) — iOS + Android from single codebase, excellent audio recording libraries
Audio Storage	Cloudflare R2 or AWS S3 — encrypted audio files with auto-deletion policy after transcription (optional retention)
Auth	Supabase Auth — Google, Apple, email sign-in with Row Level Security for data isolation
Payments	RevenueCat — wraps App Store + Play Store subscriptions, handles trials, regional pricing, analytics
Push Notifications	Firebase Cloud Messaging — morning nudges, streak reminders, weekly report alerts
Analytics	PostHog (self-hosted option for privacy) — retention funnels, feature usage, conversion tracking
Deployment	Docker + Fly.io (backend) — auto-scaling, multi-region for low latency; EAS Build for mobile

4.3 Data Architecture

Core Data Models

Entity	Key Fields	Purpose
User	id, email, name, timezone, preferences, subscription_tier, created_at	Core user record
Entry	id, user_id, audio_url, transcript, duration_secs, recorded_at	Raw nightly check-in data
EntryAnalysis	entry_id, emotional_tone[], topics[], key_quotes, reflection_text, mood_score (1–100)	AI-generated analysis per entry
EmotionalMetric	user_id, date, mood_score, anxiety_level, energy_level, dominant_emotions[], voice_metrics{}	Daily emotional snapshot for Mood Map
Pattern	user_id, type (recurring/contradiction/growth/avoidance), description, evidence_entry_ids[], detected_at, status	AI-detected behavioral patterns
PersonMention	user_id, name, sentiment_history[], mention_count, first_mentioned, last_mentioned	Relationship Map data
LifeChapter	user_id, title, start_date, end_date, summary, mood_arc, entry_ids[], status (active/closed)	Auto-segmented life chapters
EntryEmbedding	entry_id, embedding_vector (1536d), chunk_text	Vector store for semantic retrieval
NudgeSent	user_id, entry_id, nudge_text, sent_at, opened	Morning nudge delivery tracking

4.4 AI Context Window Management

The most technically critical challenge in DreamLog is giving Claude enough context about the user's history to generate meaningful, personalized reflections without exceeding token limits or costs.

Strategy: Layered Summarization + Semantic Retrieval

1. Every entry gets a short summary (2–3 sentences) stored alongside the full transcript.
2. Every week, a “weekly digest” is generated: key themes, emotional trends, notable moments. This replaces individual entry summaries in the context.
3. Every month, weekly digests are compressed into a “monthly emotional profile”: dominant patterns, growth areas, key events, and relationship dynamics.
4. When generating a nightly reflection, the context sent to Claude is: user profile + current month's weekly digests + last 3 individual entry summaries + any semantically similar past entries (retrieved via pgvector) + active patterns. This keeps context under 8K tokens while maintaining deep personalization.

5. For weekly/monthly reports, more context is loaded (up to 32K tokens) since these are background jobs where latency is acceptable.

5. Detailed Feature Specification

5.1 Voice Recording

Attribute	Specification
Max recording duration	30 minutes hard cap. Gentle “Take your time” indicator at 15 min (no interruption). AI adapts response depth to entry length.
Min recording duration	No minimum. A 45-second “Today was fine, just tired” is a valid entry. AI gives a shorter, lighter reflection for brief entries.
Audio format	AAC, 64kbps mono (smallest file size while maintaining speech clarity)
Upload behavior	Background upload after recording; retry on failure; queue if offline
Audio retention	Audio deleted from server after transcription (default). Option to keep audio in Pro tier
Languages supported	All 50+ Whisper-supported languages; auto-detected from speech
Offline capability	Record offline; auto-upload and process when connectivity returns

5.2 Onboarding Flow

- Welcome screen: “DreamLog is your nightly companion. Talk, and it listens. Over time, it’ll understand you better than you understand yourself.”
- Quick profile: Name, timezone, what time they usually go to bed (for notification scheduling).
- Emotional baseline: “In one sentence, how would you describe where you are in life right now?” (voice or text). This seeds the AI’s initial understanding.
- First recording prompt: “Take a moment. How was your day? What’s on your mind tonight?” (soft prompt to reduce blank-canvas anxiety).
- After first entry: Show the reflection. This is the “aha moment” — the user sees the AI actually understood them. If this lands, they’ll come back tomorrow.
- Set morning nudge time and notification preferences.
- Explain the 7-day free trial and what unlocks with Pro.

5.3 Notification Strategy

Notifications are critical for daily retention but must never feel nagging. DreamLog uses a “gentle persistence” model:

Notification	Timing	Content Strategy
Evening reminder	30 min before user’s bedtime	Varies nightly. Sometimes a question (“Anything happen today worth talking about?”), sometimes a gentle nudge (“Your DreamLog is ready when you

		are”), sometimes a pattern tease (“I noticed something interesting in your recent entries...”)
Morning nudge	User-set time (default 7:30am)	One personalized line based on last night’s entry. Always actionable or supportive, never generic
Weekly report ready	Sunday evening	“Your weekly reflection is ready. See what your week looked like from the inside.”
Streak at risk	If no entry for 2 days	Gentle, not guilt-inducing: “Haven’t heard from you in a couple days. Everything okay? I’m here whenever you want to talk.”
Pattern discovered	When AI detects new pattern	“I found a pattern in your recent entries you might want to see.” (Pro users only)
Milestone	After 7, 30, 90, 365 days	“30 days with DreamLog. Here’s what’s changed.”

5.4 Safety & Crisis Detection

This is non-negotiable and must be built from Day 1. DreamLog will encounter users in genuine crisis.

1. Every entry is screened for crisis signals: mentions of self-harm, suicidal ideation, domestic violence, substance abuse crisis.
2. If crisis detected, the reflection is replaced with a compassionate, direct message acknowledging their pain and providing localized crisis resources (988 Lifeline in US, equivalent in other countries).
3. The app never tries to “be the therapist” in crisis moments. It connects people to real help.
4. A persistent “Get Help Now” button is always accessible from any screen, linking to crisis hotlines.
5. All crisis detection logic is reviewed by a licensed mental health professional before launch.
6. Clear in-app disclaimer: “DreamLog is a wellness companion, not a replacement for professional mental health care.”

6. Subscription Model & Monetization

6.1 Tier Structure

Feature	Free	Pro (\$7.99/mo)	Premium (\$14.99/mo)
Nightly voice check-in	5 per month	Unlimited	Unlimited
AI reflection after entry	Basic (2–3 sentences, no history)	Deep (references full history)	Deep + follow-up conversation
Morning nudge	Generic wellness tip	Personalized to last entry	Personalized + actionable task
Mood Map	Last 7 days only	Full history + trends	Full history + correlations
Pattern Radar	—	Top 3 patterns per month	Unlimited, real-time alerts
Life Chapters	—	Auto-generated chapters	Chapters + custom tagging
Relationship Map	—	—	Full relationship graph
Dream Decoder	—	—	Unlimited dream analysis
Therapist Prep Report	—	—	Exportable PDF reports
Weekly Report	—	Full weekly summary	Weekly + monthly deep dive
Deep Dive conversation	—	3 per week	Unlimited
Voice audio retention	Deleted after transcription	Kept for 90 days	Kept indefinitely
Export data	Text only	Full JSON export	Full export + PDF journal book

6.2 Pricing Strategy

- Annual plans: Pro at \$59.99/year (save 37%), Premium at \$99.99/year (save 44%)
- 7-day free trial of Pro for all new users (conversion-critical)
- Regional pricing: India/SEA/LATAM at ~40% of US price (Pro at ₹249/month or equivalent)
- Student discount: 50% off with .edu email verification
- Family plan (future): 2 accounts at \$11.99/month, 4 accounts at \$17.99/month

6.3 Conversion Strategy

The free tier is deliberately designed to give users a taste of the magic (the first reflection is always powerful) but create natural upgrade pressure:

- Free users get 5 entries/month. After their 5th entry, they see a locked Pattern Radar teaser: “We’ve detected 2 patterns in your entries. Upgrade to see them.” This is extremely effective because the user is already emotionally invested.
- The 7-day trial is triggered after the user’s 2nd entry (not at sign-up). This ensures only engaged users hit the trial, maximizing conversion.
- Weekly report email is sent to free users with a blurred preview: “Your weekly emotional summary is ready” with just enough visible to make them want the full version.
- Streak messaging: “You’ve checked in 5 days in a row! Pro users see their full pattern analysis at this stage.”
- At the end of trial: show a personalized summary of everything DreamLog learned about them. “In 7 days, we detected 3 patterns, tracked your mood across 7 entries, and helped you process [topic]. Keep this going?”

6.4 Additional Revenue Streams (Post-Launch)

- Themed guided prompt packs: “Processing Grief”, “Career Clarity”, “Relationship Audit” (\$2.99 each or included in Premium)
- Annual “Year in Review”: beautifully designed personal reflection book (digital or printed via partner) showing the user’s entire emotional year. \$9.99 for digital, \$29.99 for printed and shipped.
- B2B: License DreamLog as an employee wellness tool to companies (\$5/employee/month). HR gets aggregate anonymized mood data; employees get free Pro access.
- API licensing: offer the emotional analysis engine to other wellness apps, therapy platforms, or HR tools.
- Affiliate partnerships with therapy platforms (BetterHelp, Talkspace) — when DreamLog suggests professional help, use a referral link.

7. Development Roadmap

Phase 1: Core MVP (Weeks 1–5)

Goal: A working app you personally use every night. Voice recording, transcription, AI reflection with basic history awareness, and a simple entry timeline.

1A. Infrastructure & Backend (Week 1)

1. Initialize Go backend with Gin, project structure, and API endpoint scaffolding
2. Design and implement PostgreSQL schema for all core entities
3. Set up Cloudflare R2 bucket for encrypted audio storage with signed URLs
4. Configure Redis for caching and background job queue
5. Set up Docker Compose local dev environment
6. Initialize React Native (Expo) project with navigation and theming
7. Implement Supabase Auth with Google and Apple sign-in
8. Set up CI/CD: GitHub Actions for backend, EAS for mobile builds

1B. Voice Recording & Transcription (Week 1–2)

1. Build the recording screen: one-tap record, waveform visualization, timer display
2. Implement audio recording in React Native using expo-av (AAC, 64kbps mono)
3. Build background audio upload to R2 with retry logic and offline queue
4. Integrate Whisper API for transcription with language auto-detection
5. Build transcription pipeline: upload audio → transcribe → store transcript → delete audio (default)
6. Handle edge cases: very short recordings, silence, background noise, multiple languages

1C. AI Analysis & Reflection Engine (Week 2–3)

1. Build Claude API integration with structured output prompting
2. Design the master analysis prompt: extract emotional tone, topics, key quotes, mood score (1–100)
3. Implement entry summarization: generate 2–3 sentence summary for each entry
4. Build context assembly pipeline: gather user history (summaries + recent entries) for personalized reflection
5. Implement the reflection generator: produces 3–5 sentence personalized reflection referencing user history
6. Build the reflection display screen with calming UI and “Goodnight” / “Tell me more” options

7. Implement basic “Tell me more” 2–3 exchange conversation flow
8. Add crisis detection screening on every entry with appropriate response handling

1D. Entry Timeline & Basic Mood Tracking (Week 3–4)

1. Build scrollable entry timeline (list of past entries with date, mood indicator, topics)
2. Create entry detail view: full transcript, AI reflection, mood score, topics
3. Implement daily mood score storage and basic 7-day mood chart
4. Build search across entries (keyword search on transcripts)
5. Add entry playback: play original audio if user opted to retain it

1E. Morning Nudge & Notifications (Week 4–5)

1. Implement morning nudge generation: after nightly analysis, generate and schedule next-morning nudge
2. Integrate Firebase Cloud Messaging for push notifications
3. Build notification scheduling system: evening reminder, morning nudge, streak-at-risk
4. Create notification settings screen: timing preferences, opt-in/out per type
5. Implement streak tracking system with counter and milestone alerts
6. Build onboarding flow (7-step flow described in Section 5.2)

Phase 2: Intelligence Layer (Weeks 6–10)

Goal: Add Pattern Radar, Mood Map, Life Chapters, and the subscription system. This is where DreamLog becomes genuinely differentiated.

2A. Pattern Radar

1. Build the pattern detection pipeline: runs weekly on all entries, comparing against full user history
2. Implement pattern types: recurring triggers, people-based patterns, contradictions, avoidance, growth moments, cyclical patterns
3. Create pattern storage with evidence linking (which entries support each pattern)
4. Build Pattern Radar UI: card-based feed of detected patterns with evidence excerpts
5. Add pattern notifications for Pro/Premium users when new patterns are detected
6. Implement pattern dismissal and user feedback (helpful/not helpful) to improve detection

2B. Mood Map

1. Build comprehensive mood tracking: daily scores, anxiety levels, energy levels, dominant emotions
2. Implement voice tone analysis microservice: extract pitch, pace, energy from audio using librosa
3. Create the Mood Map visualization: interactive line chart with zoomable timeline
4. Add correlation overlays: day of week, mentioned people, mentioned activities, sleep/exercise references
5. Build tap-to-explore: tap any day on the chart to see entry summary
6. Implement exportable mood report for sharing with therapists (PDF)

2C. Life Chapters

1. Build chapter detection algorithm: cluster entries by emotional themes and topics using embeddings
2. Implement auto-titling and summary generation for each chapter
3. Create chapter timeline UI: visual story of the user's emotional life
4. Build chapter detail view: mood arc within chapter, key moments, turning points
5. Add manual chapter creation and custom tagging (Premium feature)

2D. Subscription System

1. Integrate RevenueCat for iOS and Android subscription management

2. Build paywall screen with Free/Pro/Premium comparison
3. Implement 7-day Pro trial (triggered after 2nd entry, not at sign-up)
4. Build feature gating: lock Pattern Radar, deep reflections, and advanced features behind Pro/Premium
5. Add regional pricing tiers through RevenueCat
6. Implement student discount verification flow
7. Build subscription management screen: upgrade, downgrade, cancel, restore purchases
8. Create trial-end conversion screen with personalized summary of what DreamLog learned
9. Set up RevenueCat webhooks for subscription lifecycle events

Phase 3: Engagement & Growth (Weeks 11–16)

Goal: Launch publicly, build viral growth mechanics, and add Dream Decoder and Relationship Map to drive Premium upgrades.

3A. Dream Decoder

1. Build dream detection from entry transcripts (AI identifies when user describes a dream)
2. Implement dream analysis prompt: Jungian archetypes, common symbolism, connection to recent emotional themes
3. Create dream journal section with separate timeline of dream entries and analyses
4. Build “Dream + Reality” connection view: show how dream themes mirror waking concerns

3B. Relationship Map

1. Build person mention extraction from transcripts (detect names, nicknames, relationship labels)
2. Implement sentiment tracking per person over time
3. Create visual relationship map: interactive graph showing people, frequency, and sentiment
4. Build per-person detail view: sentiment history, mention timeline, AI-generated relationship insight
5. Add “missing connection” alerts: flag when a frequently mentioned person disappears from entries

3C. Weekly & Monthly Reports

1. Design and build the weekly report: emotional summary, top patterns, notable moments, visualizations
2. Build monthly deep dive report: comprehensive analysis, chapter updates, growth tracking
3. Create shareable report cards optimized for Instagram Stories format
4. Implement email delivery of weekly summaries (drives re-engagement for lapsed users)

3D. Growth & Marketing

- App Store Optimization: screenshots showing reflections, Mood Map, Pattern Radar; preview video showing a real check-in
- Launch TikTok and Instagram content: “My AI noticed a pattern I couldn’t see”, “What DreamLog told me after 30 days”, “Exposing my emotional patterns”
- Reddit launch: r/selfimprovement, r/mentalhealth, r/journaling, r/getdisciplined
- Product Hunt launch with compelling demo

- Partner with therapy and self-improvement podcasts for sponsored segments
- Build SEO content: “Why you can’t stick to journaling”, “How to track your mental health”, “Voice journaling benefits”
- Create “30 Days of DreamLog” challenge as viral campaign
- Referral program: give a friend 2 weeks of Pro free, get 2 weeks yourself

Phase 4: Scale & Defensibility (Weeks 17–24+)

Goal: Build the moat, expand revenue streams, and move toward \$50K+ MRR.

4A. Therapist Prep & Professional Integration

- Build therapist prep report generator: exportable PDF with session-ready summary
- Create therapist-facing landing page: encourage therapists to recommend DreamLog to clients
- Add therapist email share: one-tap share of prep report before appointments
- Explore partnerships with BetterHelp, Talkspace, and Cerebral for referral revenue

4B. Guided Journeys (Premium Content)

- Build “Journey” framework: multi-week guided prompt sequences for specific life challenges
- Launch initial journeys: Processing Grief (8 weeks), Career Clarity (6 weeks), Relationship Audit (4 weeks), Anxiety Toolkit (4 weeks), New Parent Adjustment (6 weeks)
- Each journey includes specific nightly prompts, tailored analysis, and milestone reflections
- Journeys can be sold as one-time purchases (\$4.99 each) or included in Premium

4C. Year in Review

- Build annual review generator: AI creates a comprehensive narrative of the user’s year
- Include: life chapters timeline, emotional arc, top patterns, growth milestones, relationship shifts, and a personalized letter from the AI reflecting on the user’s journey
- Offer as digital PDF (\$9.99) or printed hardcover book shipped to door (\$29.99 via print partner)
- This becomes DreamLog’s annual revenue event, similar to Spotify Wrapped

4D. Enterprise / B2B Wellness

- Build anonymized team mood dashboard for HR/people teams
- Offer DreamLog as an employee wellness benefit (\$5/employee/month)
- HR sees aggregate trends (not individual data): team stress levels, morale shifts, seasonal patterns
- Employees get free Pro access paid by employer
- This de-risks revenue away from pure consumer subscriptions

4E. Platform & API

- Build public API for the emotional analysis engine
- License to other apps: meditation apps, therapy platforms, corporate wellness tools, HR software
- Create developer documentation and sandbox environment
- Apple Watch companion: quick voice check-in from wrist, haptic morning nudge
- Explore integration with Apple Health (mood tracking in Health app)

8. Master Task Reference

Priority: P0 = must-have for launch, P1 = high value, P2 = important, P3 = nice-to-have.

Phase	Task	Pri	Effort	Notes
1A	Go backend with Gin + API scaffolding	P0	3 hrs	Foundation
1A	PostgreSQL schema (all core entities)	P0	5 hrs	Design carefully upfront
1A	R2 encrypted audio storage + signed URLs	P0	3 hrs	Privacy-critical
1A	Redis cache + job queue setup	P1	2 hrs	Async AI processing
1A	Docker Compose local dev	P1	2 hrs	Go + PG + Redis + MinIO
1A	React Native (Expo) project init	P0	3 hrs	Nav, theming, structure
1A	Supabase Auth (Google + Apple)	P0	3 hrs	Core sign-in flow
1A	CI/CD pipeline	P2	3 hrs	GitHub Actions + EAS
1B	Recording screen + waveform viz	P0	6 hrs	Core UX moment
1B	Audio recording (expo-av, AAC mono)	P0	4 hrs	Test across devices
1B	Background upload with retry + offline queue	P0	4 hrs	Reliability is key
1B	Whisper API transcription integration	P0	4 hrs	Language auto-detect
1B	Transcription pipeline (upload → transcribe → store → delete)	P0	4 hrs	Privacy-first flow
1B	Edge cases (silence, noise, short audio)	P1	3 hrs	Graceful handling
1C	Claude API integration + structured output	P0	6 hrs	Core intelligence
1C	Master analysis prompt (tone, topics, mood score)	P0	8 hrs	Extensive prompt engineering
1C	Entry summarization (2–3 sentence per entry)	P0	3 hrs	For context management
1C	Context assembly pipeline	P0	6 hrs	History-aware reflections
1C	Reflection generator (3–5 sentence personalized)	P0	8 hrs	The magic moment
1C	Reflection display + Goodnight/Tell me more	P0	4 hrs	Calming, minimal UI
1C	Deep dive conversation (2–3 exchanges)	P1	4 hrs	Optional post-reflection
1C	Crisis detection screening	P0	6 hrs	Non-negotiable safety
1D	Entry timeline (scrollable list)	P0	4 hrs	Past entries browse
1D	Entry detail view	P0	3 hrs	Transcript + reflection
1D	7-day mood chart	P1	3 hrs	Basic visualization
1D	Keyword search across entries	P2	3 hrs	Find past topics
1E	Morning nudge generation + scheduling	P0	5 hrs	Key retention driver
1E	FCM push notification integration	P0	3 hrs	Delivery infrastructure
1E	Notification scheduling system	P0	4 hrs	Evening, morning, streak

1E	Streak tracking + milestones	P1	3 hrs	Gamification layer
1E	Onboarding flow (7 steps)	P0	6 hrs	First impression matters
2A	Pattern detection pipeline	P0	10 hrs	Crown jewel feature
2A	6 pattern types implementation	P0	8 hrs	Recurring, contradiction, etc.
2A	Pattern Radar UI (cards + evidence)	P0	6 hrs	Compelling display
2A	Pattern notifications	P1	2 hrs	Alert on new discovery
2A	Pattern feedback system	P2	2 hrs	Improve accuracy
2B	Full mood tracking system	P0	4 hrs	Daily emotional metrics
2B	Voice tone analysis microservice	P1	8 hrs	librosa pitch/pace extraction
2B	Mood Map interactive visualization	P0	8 hrs	Zoomable chart
2B	Correlation overlays	P1	6 hrs	People, activities, days
2B	Exportable mood PDF for therapists	P2	4 hrs	Premium feature
2C	Chapter detection algorithm	P1	8 hrs	Embedding-based clustering
2C	Auto-titling + summary generation	P1	4 hrs	AI-generated narratives
2C	Chapter timeline UI	P1	6 hrs	Visual life story
2D	RevenueCat integration (iOS + Android)	P0	6 hrs	Payment infrastructure
2D	Paywall screen + tier comparison	P0	4 hrs	Conversion-critical
2D	7-day trial (triggered after 2nd entry)	P0	3 hrs	Smart trial timing
2D	Feature gating system	P0	4 hrs	Lock premium features
2D	Regional pricing + student discount	P1	3 hrs	Expand addressable market
2D	Trial-end conversion screen	P0	4 hrs	Personalized pitch
3A	Dream detection from transcripts	P1	4 hrs	Premium differentiator
3A	Dream analysis prompt + UI	P1	6 hrs	Engaging and shareable
3B	Person mention extraction	P1	6 hrs	NLP entity extraction
3B	Relationship Map visualization	P2	8 hrs	Interactive graph
3C	Weekly report generation	P0	8 hrs	Retention driver
3C	Shareable report cards (Stories format)	P1	4 hrs	Organic growth
3D	ASO + App Store launch	P0	4 hrs	Screenshots, video, keywords
3D	Landing page / marketing site	P0	6 hrs	SEO + conversion
3D	Social content creation	P0	Ongoing	TikTok, Reels strategy
3D	Referral program	P1	4 hrs	Viral acquisition
4A	Therapist prep report (PDF export)	P2	6 hrs	Clinical use case
4B	Guided Journey framework + 3 journeys	P1	12 hrs	Premium content revenue
4C	Year in Review generator	P2	10 hrs	Annual revenue event
4D	Enterprise mood dashboard (B2B)	P2	16 hrs	Revenue diversification
4E	Public API for emotional analysis	P3	12 hrs	Platform play
4E	Apple Watch companion	P3	8 hrs	Quick wrist check-ins

9. Timeline & Revenue Milestones

Timeline	Phase	Milestone	Revenue Target
Week 1–2	1A + 1B	Recording + transcription working end-to-end	Internal testing
Week 3–4	1C	AI reflections feeling genuinely personal	Use it every night yourself
Week 5	1D + 1E	Timeline, mood chart, morning nudges live	10 beta testers using nightly
Week 6–8	2A + 2B	Pattern Radar + Mood Map working	50 beta testers, first “wow” moments
Week 9–10	2C + 2D	Life Chapters + subscriptions live	App Store launch
Week 11–13	3A + 3B + 3C	Dream Decoder, Relationship Map, reports	\$1,000 MRR
Week 14–16	3D	Full marketing push + viral content	\$5,000 MRR
Week 17–20	4A + 4B	Therapist prep, Guided Journeys	\$15,000 MRR
Week 21–24	4C + 4D + 4E	Year in Review, B2B, API	\$30,000+ MRR

10. Cost Projections

Item	MVP (0–500 users)	Growth (5K+ users)
Hosting (Fly.io)	\$5–15/mo	\$50–100/mo
PostgreSQL (Supabase/managed)	\$0–25/mo	\$50–100/mo
Redis	\$0 (local)	\$15–30/mo
Whisper API (~\$0.006/min, avg 5 min/user/day)	\$10–40/mo	\$300–800/mo
Claude API (Sonnet for reflections)	\$15–40/mo	\$200–600/mo
Audio storage (R2)	\$0–5/mo	\$10–30/mo
FCM / Supabase Auth	\$0 (free tier)	\$0–25/mo
RevenueCat	\$0 (free < \$2.5K MRR)	1% of MRR
Voice tone analysis (compute)	\$0–10/mo	\$30–80/mo
Apple + Google dev accounts	\$124 one-time	\$99/year renewal
PostHog analytics	\$0 (free tier)	\$0–50/mo
Total Estimated	\$25–115/mo	\$500–1,500/mo

Unit economics at scale: With an average user generating ~\$0.06/day in AI costs (Whisper + Claude) for an average 5-minute session and paying \$7.99/month, gross margin is approximately 75–85%. Longer sessions (15–30 min) cost more per user but these power users are overwhelmingly on paid tiers, maintaining healthy margins.

11. Competitive Landscape

Competitor	What They Do	What They Miss	DreamLog Advantage
Calm / Headspace	Guided meditation, sleep stories, breathing	Passive. Doesn't know you. Generic content for everyone	DreamLog is active (you talk) and deeply personalized (it remembers everything)
Day One / Journey	Written journaling with prompts and photos	Writing is high friction (92% quit). No AI analysis. No pattern detection	Voice is 10x easier. AI provides insight you can't get from re-reading your own writing
Replika / Character.ai	AI chatbot companions	No memory between sessions. Entertainment-focused. No longitudinal analysis	DreamLog remembers everything and provides clinical-grade insight over time, not just chat
BetterHelp / Talkspace	Online therapy with real therapists	\$60–90/week. Requires scheduling. Therapists change. Limited to 1hr/week	DreamLog is 24/7, \$8/month, and processes thoughts daily. Complement, not replacement
Rosebud / Reflectly	AI-assisted journaling (text-based)	Still text input. Basic AI. Limited pattern detection. No voice	Voice-first removes all friction. Deeper AI with long-term memory and pattern radar
Otter / Fireflies	Meeting transcription and notes	Work-focused. No emotional analysis. No personal context	Completely different use case — DreamLog is personal, emotional, and wellness-focused

DreamLog's positioning: "Calm helps you relax. BetterHelp gives you therapy. DreamLog actually understands you."

12. Risks & Mitigations

Risk	Impact	Mitigation
User in genuine crisis and app response is inadequate	Reputational and moral damage; potential liability	Crisis detection from Day 1. Never play therapist. Always route to professional help. Disclaimers throughout. Review by licensed professional. Regular audits of crisis responses
AI generates harmful or triggering reflection	User trust destroyed; potential psychological harm	Guardrails in every prompt: never diagnose, never catastrophize, never dismiss emotions. Output filtering layer. User flagging mechanism. Weekly manual review of flagged entries
Privacy breach of voice recordings or emotional data	Catastrophic trust loss; legal liability	End-to-end encryption. Audio deleted after transcription by default. Zero-knowledge architecture where possible.

		Regular security audits. GDPR and CCPA compliance from Day 1
User dependency (unhealthy reliance on AI for emotional processing)	Ethical concerns; media backlash	Regularly encourage professional help. Set healthy boundaries in AI responses. Include periodic prompts to talk to real people. Never position as therapy replacement
Low retention after novelty wears off	Revenue stalls, high churn	Pattern Radar and Life Chapters create deepening value over time. The longer you use it, the more valuable it becomes. Weekly reports and morning nudges maintain daily habit
App Store rejection for health claims	Launch delayed or blocked	Position as “wellness companion” and “journaling tool”, never as medical device. Avoid claims about treating conditions. Follow Apple and Google health app guidelines precisely
Claude API costs spike at scale	Margins compressed	Layered summarization reduces tokens. Use Haiku for simple tasks, Sonnet for reflections. Cache common patterns. Batch non-urgent analysis. Explore on-device models for basic tasks
Competitor (Calm, Headspace) copies the feature	Market pressure, feature war	Data moat: months of emotional history is irreplaceable. Move fast on niche features. Community and brand loyalty. DreamLog is voice-first and AI-native, hard to bolt onto an existing meditation app

13. Privacy & Ethics Framework

DreamLog handles the most intimate data possible — people's unfiltered thoughts and emotions. Privacy and ethical AI use are not features; they are the foundation of the entire product.

Data Privacy Principles

- Audio recordings are deleted from servers immediately after transcription by default. Pro/Premium users may opt to retain audio, stored encrypted.
- All data encrypted at rest (AES-256) and in transit (TLS 1.3)
- User data is never used for AI model training without explicit, separate, revocable consent
- Zero data sharing with third parties, advertisers, or data brokers — ever, under any circumstances
- User can export all their data (full JSON + audio) at any time with one tap
- User can permanently delete all data at any time. Deletion is real — not soft-delete, not archived. Gone.
- GDPR, CCPA, and PIPEDA compliant from Day 1
- Annual third-party security audit once revenue supports it

Ethical AI Principles

- DreamLog never diagnoses mental health conditions
- DreamLog never prescribes medication or treatment
- DreamLog never discourages users from seeking professional help
- DreamLog periodically reminds long-term users that a human therapist can offer things AI cannot
- All AI reflections include implicit (never preachy) encouragement of self-agency: “What do you think?” rather than “You should...”
- The AI never takes sides in interpersonal conflicts described by the user — it helps the user think, not tells them what to do
- No dark patterns in subscription UX: cancellation is as easy as sign-up, no guilt-tripping

Content Moderation

- If a user describes harming someone else, the AI does not engage and provides appropriate resources
- If content suggests illegal activity, the AI disengages from that topic
- All AI outputs are filtered for potential harm before display
- Users can flag any AI response as inappropriate, triggering manual review

*Everyone has thoughts they can't organize,
feelings they can't explain,
and patterns they can't see.*

DreamLog is the listener they've been waiting for.

Build it. Talk to it. Ship it. Change lives.
